

The solenoid valve block 2-row made of 1.4305 is used for stream switching up to 10 different streams. The second valve row is for quick pre purging. These valves are activated shortly before the dedicated stream is analyzed. The valves are rapid switching solenoid valves, which have a very long life time – tested over 500 million switching operations. The connections for the individual sample gases and the calibration gases are made by flange adapters, which have integrated sinter metal filters. In addition the sample gas inlet can be equipped with a continuously bypass. The valve block has a common tubule which is connected to the analyzer. The other side of the tubule has a blind flange. Alternatively at low concentrations this flange will be changed by a capillary for a very low split flow. This solenoid valve block is used in applications for gas filling plants or for applications with very expensive gases where low gas consumption is essential or in applications with a lot sample inputs while at the same time low cycle time is needed.
