

The solenoid valve block 4-row made of 1.4305 is used for air monitoring, especially if a redundant measurement with two analyzers in each case is needed. The following functions are possible:

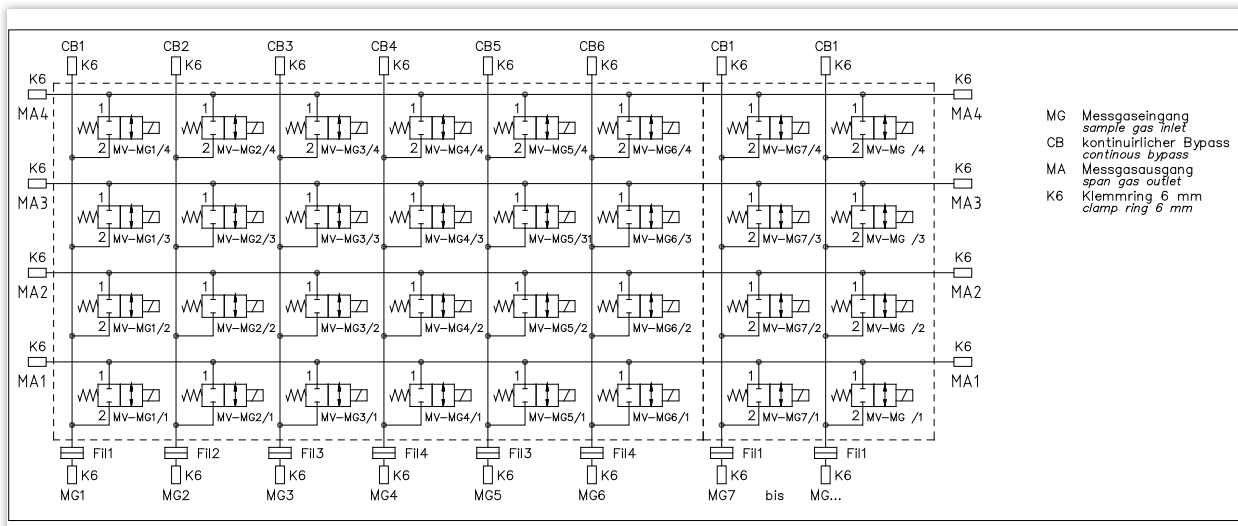

1. Sample switching to analyzer A1
2. Sample switching to analyzer B1
3. Sample switching to analyzer A2
4. Sample switching to analyzer B2
5. Continuous bypass flow

The valve block consists of a 4-row basic unit with 6 sample inlets. This basic unit can be extended with other basic units as often as required. The valves are rapid switching solenoid valves, which have a very long life time – tested over 500 million switching operations. The connections for the individual sample gases and the calibration gases are made by flange adapters, which have integrated sinter metal filters. Additionally, each sample inlet can be equipped with a continuous bypass flow.
